## Pencils of quadrics and the arithmetic of hyperelliptic curves

**Abstract:** In recent joint works with Manjul Bhargava and Benedict Gross, we showed that a positive proportion of hyperelliptic curves over  $\mathbb{Q}$  of genus  $g$  have no points over any odd degree extension of  $\mathbb{Q}$ . This is done by computing certain 2-Selmer averages and applying a result of Dokchitser-Dokchitser on the parity of the rank of the 2-Selmer groups in biquadratic twists. In this talk, we will see how arithmetic invariant theory and the geometric theory of pencils of quadrics are used to obtain the 2-Selmer averages.
